

ABSTRACT

There is disclosed a sealing material for an ant groove, wherein the sealing material is easy to fit to the ant groove and little involves a phenomenon such that the sealing material unfavorably slips out of the ant groove in the form of remaining
5 fixing to the opposite member when the sealed place is opened, and wherein the sealing material can exercise the good sealing function. The sectional shape of the sealing material has: a straight bottom edge 34 which is disposed on a bottom face of the ant groove 12; an arched convex edge 31 which contacts with the other member 20; a first projecting edge 33 which projects outside; a concave inlet portion 39; a
10 second projecting edge which is composed of straight lines 35, 36 that project outside; a straight sloping edge 38; and at least one corner portion 37a-c which is constituted in the range of from the straight bottom edge 34 via the second projecting edge 35, 36 to the sloping edge 38.
